

Programming Assignment 4

The device I used for this programming assignment was my Raspberry Pi 4 running Debian Bullseye. I used gcc to compile my code running this command: `gcc jh4411_myfstat.c -o myfstat`. I ran the binary through the usual method of doing `./`.

I didn't really run into any issues while I was coding up this assignment. I linked the sources I used as comments in the file and the code I wrote is mostly self-explanatory, so I didn't write many comments explaining what I was doing. I did end up adding another function and an enum to help make the consts' that were used in the man page for stat more readable.
